This includes the pool header and the code needed to hook into the rest of the system. For the instruction emulation code, the hooks are vectors in the SCB. Environment: MODE=Kernel Author: Kathleen D. Morse, Creation date: 04-May-1983 51 52 53 Modified by: V03-004 LJK0028 10-Apr-1984 Lawrence J. Kenah Store base address of emulator image in cell in SYS.EXE 55 set aside for that purpose. 57 V03-003 LJK0027 Lawrence J. Kenah 21-Mar-1984 Store address of access violation handler into EXESGL_VAXEXCVEC when loading decimal/string emulator.

The working set limit was 900 pages.
16794 bytes (33 pages) of virtual memory were used to buffer the intermediate code.
There were 20 pages of symbol table space allocated to hold 247 non-local and 5 local symbols.
262 source lines were read in Pass 1, producing 17 object records in Pass 2.
